From diagnosis to optimal treatment...

HIV care in designated centres

When a person is diagnosed with HIV, they are referred to a designated HIV treatment centre in the Netherlands. At every hospital visit, the treatment team records the patient's medical information in the patient's medical file.

What information does SHM collect?

SHM collects HIV-specific information, such as viral load suppression, immune recovery, HIV drug resistance and overall survival. SHM also collects information on diseases in people living with HIV, which are becoming more important as these people reach an older age.

SHM contributes to global HIV research

Our data are also used in national and international HIV research. This research provides tangible input into HIV treatment guidelines and prevention policies and leads to improvements in HIV care worldwide.

Improving care

SHM also provides treatment centres with regular updates of their own data. These updates are used by the centres and care teams to review their performance and improve patient care.

Stichting HIV Monitoring (SHM) collects medical information

With the patient's approval, SHM collects the patient's medical information at the treatment centre for research and national reporting. This helps to maintain the high quality of HIV care in the Netherlands.

Privacy

SHM adheres to national privacy regulations laid down for medical research. Individual patients can never be directly identified through data collected by SHM.

SHM furthers knowledge on HIV

Research using data from SHM furthers knowledge on HIV in the Netherlands. In particular, our research helps to understand the effect of lifelong treatment in people living with HIV. We regularly present our work in international medical journals and in our yearly Monitoring Report.

SHM carries out rigorous quality controls

Research requires high quality data. To ensure the collected information is accurate and reliable, various rigorous quality control steps are carried out. After further processing, the data are stored in our highly secure 'data warehouse', ready for use in research.

Stichting HIV Monitoring

Founded in 2001, Stichting HIV Monitoring (SHM) was appointed by the Dutch Ministry of Health, Welfare and Sport as the executive organisation for the registration and monitoring of HIV-infected patients in the Netherlands.

SHM comprehensively maps the HIV epidemic and HIV treatment outcomes in the Netherlands, thereby contributing to the knowledge of HIV. Working with all HIV treatment centres throughout the Netherlands, SHM has developed a solid framework for systematically collecting HIV data for the long-term follow up of all registered patients. The Netherlands is the only country in the world to have such a framework, which enables healthcare professionals to aspire to the highest standard of HIV care.

In addition to the national reports, healthcare professionals are provided with treatment centre-specific reports to enable them to monitor and optimise care provided in their centres. Moreover, SHM data are also made available upon request for use in HIV-related research, both in the Netherlands and internationally. The outcome of SHM's research and international collaborations provides tangible input into policy guidelines and further improves HIV care in the Netherlands.

For further information about SHM or to sign up for our newsletter, please visit our website: www.hiv-monitoring.nl or send us an email: hiv.monitoring@amc.uva.nl.
